Why are network cables essential in creating a network? Give an example.

Network cables are essential as these cables are the one that connect different networking devices and function normally. As without these, networking won't be possible at all as there are no network that will be formed from individually placed devices that are not connected to each other. Another thing, wireless is now a trend like WiFi and Bluetooth but it does not provide the same reliability of cables but as time pass by, we could see a wireless network in the future.
